

The National Research Center on the Gifted and Talented NEWSLETTER

March 1992

THE UNIVERSITY OF CONNECTICUT • THE UNIVERSITY OF GEORGIA • THE UNIVERSITY OF VIRGINIA • YALE UNIVERSITY

NRC/GT: The Latest News from The Directorate

E. Jean Gubbins, *The University of Connecticut*

We have had a wonderful response to our work at The National Research Center on the Gifted and Talented. All our contacts with the Collaborative School Districts, Consultant Bank members, State Directors of Programs for the Gifted and Talented, National Research Center Advisory Council, and State Parent and Teacher Organizations have been very positive. You have all helped us to get the word out about our research studies through newsletters, personal communications, and conferences. We have received copies of newsletters from around the country highlighting specific findings from Year 1 studies. Thanks to all of you for helping us maintain such an extensive dissemination plan.

Further updates of several Year 1 studies are the focus of this newsletter. You will learn more about:

1. Regular Classroom Practices with Gifted Students: Findings from the Classroom Practices Survey
2. The Classroom Practices Study: Observational Findings
3. The Curriculum Compacting Study
4. Investigations into Instruments and Designs Used in the Identification of Gifted Students and the Evaluation of Gifted Programs
5. The Learning Outcomes Study
6. A Theory-Based Approach to Identification, Teaching, and Evaluation of the Gifted

The University of Connecticut Research Site, under the direction of Dr. Francis X. Archambault, was responsible for implementing studies 1-3. On January 27, 1992, we held a press conference to announce the results of these studies and received extensive local, state, and national newspaper, radio, and television press coverage. The studies have generated considerable interest and the follow-up requests for more information on curriculum compacting and classroom practices have been extensive. We have been mailing information daily and returning numerous phone calls.

In addition to the 14 studies being conducted over the past two years at the Research Center, we have been working on the commissioned papers from the Research-Based Decision Making Series. The paper by Dr. Karen Rogers on *The Relationship of Grouping Practices to the Education of the Gifted and Talented Learner* has been well received. Orders for the executive summary and full-length paper are filled daily. In several instances, the findings from the paper have been used as the basis for other articles such as one by Lee Wolf, Iowa Department of Education, entitled *Grouping and the Gifted: A More Thoughtful Look in the Iowa Talented and Gifted Newsletter* (January 1992). One comment by Wolf that is quotable is: "Doing away with gifted education programs because tracking is detrimental to less able students is making too much soup from one carrot."

Look for announcements in this newsletter for other papers in the Research-Based Decision Making Series on ability grouping by Dr. James Kulik, cooperative learning by Dr. Ann Robinson, and self-concept by Dr. Robert Hoge and Dr. Joseph Renzulli. The information in these papers will help you build a strong case for creating, maintaining, or expanding programs for students with special gifts and talents.

One "small" study that we are now implementing with our Collaborative School Districts and Consultant Bank members that extends the scope of our present NRC/GT research agenda is known as Assumptions Underlying the Identification of Gifted and Talented Students. This study is an opportunity to involve our contacts in the role of "teachers as researchers." The contact persons are working with a sampling plan to obtain responses from teachers, parents, and administrators on survey items on identification — a topic that is often debated and always a concern when you begin to outline program plans. We have received hundreds of responses from over 30 states and 1 territory on items focusing on testing, student background, non-intellectual factors, and case study data. If you have not returned your surveys, there is still time.

The Collaborative School District network continues to expand. As of February 1, 1992, there are 283 districts involved with the Research Center. Welcome aboard goes out to:

Weston Public Schools
Weston, CT

Harford County Schools
Bel Air, MD

Hardin Public Schools
Hardin, MT

Contoocook Valley, SAU #1
Peterborough, NH

Eastern Camden County Schools
Voorhees, NJ

Lincoln School District
Lincoln, RI

Custer School District #1
Custer, SD

Once again, we would like to invite readers to submit articles for the *NRC/GT Newsletter* in three areas: Commentary, Just Off the Press, and Research in Progress. We would be happy to review your work. One article that appeared in the June 1991 newsletter by Linda L. Manwill entitled *Talented and Gifted Education in Rural Alaska: A Universal Model* became the focus of another article in *The New Republic* (December 16, 1991). Therefore, your submissions will reach 4,000 readers of the *NRC/GT Newsletter* and possibly thousands more around the country. Send your submissions to:

Regular Classroom Practices with Gifted Students: Findings from the Classroom Practices Survey

The University of Connecticut

Francis X. Archambault, Jr., Karen L. Westberg, and Scott W. Brown

The Classroom Practices Study was designed to determine the extent to which gifted and talented students are receiving differential education in the regular classroom setting. It addressed five research questions:

1. What instructional practices are used with gifted and talented students in classrooms across the country?
2. Do teachers modify instructional practices and curricular materials to meet the needs of gifted and talented students?
3. Do regular classroom teachers in various parts of the country provide different services for the gifted?
4. Do regular classroom teachers in various size communities provide different services for the gifted?
5. Are there differences in the types of regular classroom services provided to gifted students in districts with and without formal gifted programs?

These questions were addressed through a nationwide survey of over 7300 third and fourth grade teachers and systematic observation of 46 classrooms drawn from the survey sample. This article presents the results of the Classroom Practices Survey. Classroom observation findings are discussed in a separate article.

The sample was restricted to grades three and four since the large majority of gifted programs occur at the elementary level. The sample was constructed to enable comparison of teacher responses from various parts of the country and from various types of communities. Bureau of the Census definitions were used to classify states into regions (Northeast, South, North Central, and West). Schools were classified according to zip codes and Metropolitan Statistical Areas (MSA) into community types (urban, suburban, and rural). Using standard stratified random sampling procedures, a general sample of 3993 teachers was drawn. Using similar procedures, five additional samples were also selected. These included teachers in private (i.e., predominately church-related) schools (n=980) and teachers in schools with high concentrations of four types of ethnic minorities, namely, African-Americans (n=592), Asian-Americans (n=587), Hispanic-Americans (n=579), and Native-Americans (n=580). The response rate across the 6 samples was approximately 50%.

The *Classroom Practices Teacher Survey* solicited information on the background of teachers, the policies and procedures their schools and districts had adopted for educating gifted students, and the classroom practices teachers used with gifted and average students. Teacher reports of their own behavior with both types of students provided a measure of the extent to which gifted students were receiving an enriched or differentiated education. Teachers responded to each of the 39 items in the classroom practices portion of the survey first for average and then gifted students using a scale which included the following responses: once a month or less, a few times a month, a few times a week, daily, and more than once a day.

To increase the interpretability of the results, the 39 items were reduced to 6 factors or scales using principal factor analysis: (1) Questioning and Thinking; (2) Providing Challenges and Choices; (3) Reading and Written Assignments; (4) Curriculum Modifications; (5) Enrichment Centers; and (6) Seatwork. The variance accounted for by this solution, which included all but two of the 39 items, was 38%. Alpha reliabilities for the six factors were .84, .80, .78, .74, .72, and .53, respectively.

The most salient survey finding is that classroom teachers make only minor modifications in the regular curriculum to meet the needs of gifted students. This result was found for public and private schools, and for public schools with high concentrations of African-American, Asian-American, Hispanic-American, and Native-American students as well as for classrooms in various parts of the country and various types of communities.

Although the results clearly depict only small differences between gifted and average students, it should be noted that the repeated measures MANOVAs produced statistically significant results favoring

the gifted across all samples and scales. Cohen (1988) and others have argued that since small differences can be statistically significant when sample sizes are large, as was the case in the present research, the magnitude of the effects must also be considered when interpreting results. Most of the effect sizes were very small or negligible (below .2), thus leading to the conclusion that classroom teachers make only minor modifications in the regular curriculum to meet the needs of the gifted.

Acknowledging that the modifications are minor, teachers who provide for the gifted are likely to assign them advanced readings, independent projects, enrichment worksheets, and reports of various kinds. Some classroom teachers also attempt to eliminate material that students have mastered, provide the opportunity for more advanced level work, give gifted students some say in how classroom time is allocated, and expose gifted students to higher level thinking skills. However, gifted students are given no more opportunity than average students to work in locations other than the regular classroom, to use enrichment centers, to pursue self-selected interests, to work in groups with students having common interests, to move to a higher grade for specific subject-area instruction, to work with students of comparable ability across classrooms at the same grade level, to work on an advanced curriculum unit on a teacher-selected topic, to participate in a competitive program focusing on thinking skills/problem solving, or to receive concentrated instruction in critical thinking and creative problem solving. Further, most gifted and average students appear to participate in these experiences only a few times a month or less.

The *Classroom Practices Teacher Survey* also demonstrated that the regular classroom services provided to gifted students in schools with formal gifted programs are similar to those provided in schools without formal programs. This finding supports at least two conclusions: (1) that regular classroom teachers in districts with formal programs rely on the gifted resource teacher to meet the needs of gifted students; and (2) that gifted resource teachers have little effect on what classroom teachers do to meet the needs of the gifted, probably because these resource teachers have served primarily in a teaching role.

The results of this survey paint a disturbing picture of the types of instructional services gifted students receive in regular classrooms across the United States. Since most gifted students spend all but two or three hours per week in this environment, one could easily argue that they deserve more. Further, since many districts have eliminated or are in the process of eliminating resource room programs due to economic problems or concerns about the equity of grouping students homogeneously, the future appears even more bleak than the present.

What can be done to improve the education of gifted students? First, every effort should be made to continue, and where feasible even expand, gifted programs, thereby bringing gifted students in contact with teachers who are specially trained to meet their needs. If finances or other considerations dictate that resource rooms be eliminated, new and more concentrated efforts must be made to help classroom teachers provide gifted students with an enriched curriculum. These efforts must certainly include the development of curriculum materials specifically designed for classroom teacher use. They must also result in new approaches for training teachers to use the new materials, to identify the gifted, to compact the regular curriculum, and to become more flexible in meeting the needs of all students, including the gifted. To enable this to occur, a redefinition of the role of gifted specialist may be in order. Instead of spending the large majority of their time as a teacher of gifted students, gifted specialists of the future may be asked to spend significant portions of their time training regular classroom teachers. Thus, rather than serving primarily as a resource to students, gifted specialists may spend more of their time serving as a resource to teachers.

The authors would like to acknowledge Dawn Guenther, NRC/GT Dissemination Coordinator, for her assistance in the preparation of this article.

The Classroom Practices Study: Observational Findings

Karen L. Westberg, Francis X. Archambault, Jr., Sally M. Dobyns, Thomas J. Salvin
The National Research Center on the Gifted and Talented, The University of Connecticut

The Classroom Practices Observational Study, the second aspect of the Classroom Practices Study, was designed to verify and extend the findings from the Classroom Practices Survey administered to over 7000 third and fourth grade teachers. The Classroom Practices Study was designed to determine if and how classroom teachers meet the needs of gifted and talented students in the regular classroom. For the observational study, semi-structured observations were conducted in 46 third or fourth grade classrooms that represented school districts within the four regions of the country, as designated by the U.S. Census Bureau and districts in rural, suburban, and urban communities. Twenty-six classrooms were in schools that provided formal gifted education programs; twenty classrooms were in schools that did not have formal gifted programs.

Nonparticipant observation and semi-structured interviews were selected as the data-gathering techniques for the study. An observation instrument entitled The Classroom Practices Record (CPR) was designed to document the extent to which gifted and talented or high ability students receive modifications in curricular activities, materials, and teacher-student verbal interactions in the classroom. Codes on the CPR instrument were used to record the types of instructional activities, the size of the groups, the composition of the groups, verbal interactions, and the length and types of differentiation experienced by the target gifted and talented or high ability student during reading, language, mathematics, social studies, and science classes.

The CPR was used to record information on two target students, one gifted and talented or high ability student and one average ability student, in a classroom. By observing two target students, it was possible to compare the curriculum and instruction provided to these students in the same classroom. Trained observers spent two days in each classroom; therefore, across the 46 sites, 92 target students of each ability level were observed. Observers used student roster information provided in advance by classroom teachers and a specific protocol to select the target students for each observation day. Systematic selection procedures were developed to ensure the inclusion of minority or economically disadvantaged students in the sample. Observations and interviews were conducted in the spring of 1991, two to four months before the end of the academic year.

Descriptive statistics and chi-square procedures were used to analyze the data. A content analysis procedure was used to synthesize the anecdotal information from the daily summaries written by the observers. The major findings from the study are summarized below.

The results of the quantitative analyses indicated that the target gifted and talented or high ability students received a limited amount of differentiation in reading, language, mathematics, science, and social studies instruction. For the purposes of this study, six codes were used to record evidence of differentiation: advanced content instruction, advanced process instruction, advanced product or project instruction, independent study with assigned topics, independent study with self-selected topics, and other differentiation experiences. Across all five subject areas, the target gifted and talented or high ability students received no differentiated experiences in 84 percent of the activities in which they were involved. This was examined further by comparing these practices in schools that did and did not have formal gifted programs. In classrooms with formal gifted programs, the target gifted students received no differentiation of any sort in 84.1% of the activities; and, in schools with no gifted programs, no differentiation was observed in 84.4% of the activities.

Fourteen types of instructional activities were coded within each subject area: audio visual, demonstration, discussion, explain/lecture, games, non-academic activity, oral reading, project work, review/recitation, silent reading, simulation/role playing, testing, verbal practice or performance, and written assignments. Across all five subject areas, the target gifted and talented or high ability students were most frequently involved in written assignment (26% of the time) and review/recitation (13% of the time) activities.

The size and the composition of the instructional groups in which the target gifted and talented or high ability students participated were also examined. For the majority of the time within each subject area, students participated with the entire class. They worked individually for only 12% of the time and in small groups (2-6 students) only 13% of the time across the five subject areas.

In addition to recording the size of the groups, observers recorded the composition of the groups, i.e., homogeneous grouping or heterogeneous grouping, in which the target gifted students worked during instruction in the five subject areas. Target gifted and talented or high ability students were homogeneously grouped according to achievement or ability level for 40 percent of the time in mathematics and for 29 percent of the time in reading. Across all five subject areas, these students received instruction in homogeneous groups only 21 percent of the time.

Several analyses were conducted on the types of questions and the wait times provided with questions to target students. Codes were used to record the following types of verbal interactions: knowledge-comprehension question, higher-order question, and explanation or comment between or among the teaching adult, target gifted student, target average student, non-target students, and students-at-large. Wait time, the length of elapsed silent time after a question, was also recorded. For this study, wait time of three seconds or more was recorded. No significant differences in question types (knowledge/comprehension versus higher order thinking skills) were found between the target gifted and talented or high ability and target average students. A statistically significant, but weak association was found between the two groups of target students and the number of questions that were accompanied by at least three seconds of pre-response wait time; namely, more wait time was provided to average ability students than to gifted students.

The results of the content analysis procedure for observers' daily summaries corroborated the findings from the descriptive and chi square statistical results. The results of all analyses indicated that observers found little differentiation in instructional and curricular practices, including grouping arrangements and verbal interactions, for gifted and talented students in the regular classroom.

Despite several years of advocacy and efforts to meet the needs of gifted and talented students in this country, the results of this observational study indicate that little differentiation in the instructional and curricular practices is provided to gifted and talented students in the regular classroom. This is of particular concern because special programs for gifted learners outside of the regular classroom are being eliminated in many parts of the country due to economic cutbacks. When this occurs, the needs of gifted and talented students must be addressed in regular classrooms. Even if a gifted program exists, however, it may only provide 1-2 hours of instruction per week to identified students, making the classroom teacher's role even more essential. If gifted education is to become increasingly mainstreamed, provided in the regular classroom, several implications from this study should be considered for the education of gifted and talented students.

The Curriculum Compacting Study

The University of Connecticut

Sally M. Reis

During the 1990-1991 academic year, The University of Connecticut site of The National Research Center on the Gifted and Talented conducted a study to examine the effects of staff development on elementary teachers' ability and willingness to implement a technique entitled curriculum compacting. This technique is designed to modify the regular curriculum to meet the needs of gifted and talented students in the regular classroom. We were interested in determining how much curriculum content could be eliminated for high ability students by teachers who had received various levels of staff development. We investigated what would happen to students' achievement test scores, content area preference and attitude toward learning if curriculum compacting was implemented. To participate in this study, districts had to meet the following criteria: (1) no previous training in curriculum compacting, and (2) accept random assignment to treatment groups. Efforts were made to recruit districts with elementary student populations that included economically disadvantaged and limited English proficient students. Teachers in twenty school districts from throughout the country were randomly assigned by district to three treatment groups that received three different levels of staff development. After receiving staff development services, teachers implemented curriculum compacting for one or two students in their classroom who were selected because of their advanced academic abilities. A group of seven districts was randomly assigned as control groups.

Three escalating levels of staff development which are described below were provided to the treatment groups.

Description of materials used for staff development:

Treatment No. 1:

- 2 Videotapes (1 hour total) explaining how to compact curriculum
- 1 Book including more explanatory information about how to implement curriculum compacting (130 pages)
- Related articles/examples

Treatment No. 2:

- 2 Videotapes (1 hour total)
- 1 Book including more explanatory information about how to implement curriculum compacting (130 pages)
- Related articles/examples
- Group compacting simulations and practice conducted by local gifted and talented education consultant

Treatment No. 3:

- 2 Videotapes (1 hour total)
- 1 Book including more explanatory information about how to implement curriculum compacting (130 pages)
- Related articles/examples
- Group compacting simulations and practice conducted by local gifted and talented education consultant
- Local consultant services and peer coaching experiences

The control group teachers identified one or two high ability students and continued normal teaching practices without implementing curriculum compacting. A battery of achievement tests (out-of-level Iowa Tests of Basic Skills - ITBS), content area preference scales, and a questionnaire regarding attitude toward learning were given to identified students in November 1990 and at the completion of the school year.

The following statements represent some of the findings from the curriculum compacting study:

1. Ninety-five percent of the teachers were able to identify high ability students in their classes and document students' strengths.
2. Approximately 40-50% of traditional classroom material was compacted for selected students in one or more content areas in mathematics, language arts, science and social studies.
3. The most frequently compacted subject was mathematics, followed by language arts. Science and social studies were compacted

when students demonstrated very high ability in those areas.

4. A majority of the teachers in all treatment groups said they would compact curriculum again; some said they would try again if they had additional information and assistance from a specialist.
5. A significant difference was found among treatment groups with respect to the overall quality of curriculum compacting, as documented on a form called "curriculum compactor." Treatment group 3 had significantly higher quality compactors than did treatment groups 1 or 2.
6. Eighty percent of the teachers were able to document the curriculum that high ability students had yet to master, list appropriate instructional strategies for students to demonstrate mastery and document an appropriate mastery standard.
7. Replacement strategies consisted of three broad instructional activities: enrichment, acceleration and other (i.e., peer tutoring, cooperative learning, correcting class papers).
8. Teachers in treatment group 3 used significantly more replacement strategies than did teachers in treatment groups 1 or 2.
9. While approximately 95% of teachers used enrichment as a replacement strategy, 18% of teachers also used acceleration.
10. Replacement strategies did not often reflect the types of advanced content that would be appropriate for high ability students, indicating that additional staff development, as well as help from a specialist in the district, would be beneficial.
11. Approximately 60% of the replacement strategies reflected students' interests, needs and preferences.
12. Anecdotal records indicated that three different types of requests were made by teachers as they compacted curriculum:
 - Additional time for students to work with the gifted specialist (if one was available)
 - Assistance in locating additional appropriate materials
 - Consultant assistance as teachers worked through the compacting process.
13. When teachers eliminated as much as 50% of the regular curriculum for gifted students, no differences in the out-of-level post achievement test (ITBS) results between treatment and control groups were found in Reading, Math Computation, Social Studies and Spelling.
14. In Math Concepts and Science, all 3 treatment groups scored significantly higher on the out-of-level post test (ITBS) than did the control group whose curriculum was not compacted.

This study demonstrates the following:

- * Curriculum compacting can be implemented in the regular classroom to provide more appropriate educational experiences for gifted and talented students.
- * Staff development and peer coaching can improve teachers' use of the compacting process.
- * Teachers will need additional training and help to be able to substitute appropriately challenging content and work to students whose curriculum has been modified.
- * Curriculum compacting can have positive effects on students.

This research has implications for all who are concerned about the achievement of gifted and talented students.

Investigations into Instruments and Designs Used in the Identification of Gifted Students and the Evaluation of Gifted Programs

The University of Virginia

Carolyn M. Callahan, Paula Pizzat

As we look back on Year 1 of the identification/evaluation (ID/EVAL) research project, we recall our sense of anticipation as the steady stream of mail arrived at Lambeth House on the grounds of the University of Virginia. Staff members of the NRC/GT used computerized data-base searchers to gather all available literature on gifted identification and evaluation practices. Dissertations by authors around the country were reviewed and summarized for current practices, as well as for reliability and validity data. Our correspondence included letters and papers from professionals who submitted their most recent work pertinent to the study. Reading, cross-references, and filing over five hundred responses from school districts were all part of the preparation for the second year of NRC/GT activities. This summer, we coded and recoded the files of data into categories and began to summarize the State of the Art in Identification Practices Across the Nation.

It is a pleasure to report that the National Repository Data-base for Identification and Evaluation Instruments is now operating and underway. From the hundreds of files received from school districts and educators of the gifted, the staff of the NRC/GT has catalogued and entered data describing published and nonpublished instruments, as well as the most recent test reviews, and articles pertaining to these instruments for use with the gifted. At this writing, 244 locally developed instruments, 160 test reviews, 85 journal articles, dissertations and reports are in the various data-bases.

Staff members trained to use the *Scale for Evaluating Gifted Identification Instruments* (SEGII) are currently reviewing published instruments from the inventory of over 200 tests (using the new SEGII, developed during the first year of the NRC/GT.) We rate each instrument according to its usefulness in identification and relative to the variety of definitions and constructs of giftedness for which it might be used. Our evaluation includes close scrutiny of the several types of validity and reliability, so that the NRC/GT will be able to provide comprehensive ratings of instruments for identifying gifted youngsters.

One of our first pilot studies on a locally developed instrument is underway. We are field testing the Diet Cola Test, an instrument to measure science process skills and abilities. Over 250 fourth through eighth graders from Collaborative School Districts with high minority populations are participating in this research. We look forward to the

first round of reliability data in early 1992. Other locally developed instruments with reliability, validity and potential for identifying gifted students will be investigated through tests of reliability this spring semester.

Other collaborative activities with school districts include the preparation of the monograph, *Contexts for Promise: Noteworthy Practices in the Identification of Gifted Students*. We have signalled cases of promising practices in gifted education from the Javits Grants projects across the country, and have received confirmation from the following sites: Atlanta Public Schools, Montgomery County Public Schools in Maryland, Urban Scholars Program/University of Massachusetts-Boston, University of New Mexico, The Arts Connection/New York City, Kent State University, and the University of Wisconsin at Whitewater. Each site will prepare a chapter describing their unique project or research regarding the identification of gifted students. Also this winter, educators from four Collaborative School Districts have agreed to be interviewed about their promising practices in the field of gifted education. Information gleaned from these sites will provide the basis for additional chapters in the monograph.

At the University of Virginia we are also investigating the characteristics of program evaluations that encourage improvements in gifted programs. Ten districts have been identified from the National Repository as programs to study in this recent research. We will examine what makes effective and ineffective evaluations, as well as the use of information that affects the implementation, decision-making, or perceptions of programs for gifted learners.

Finally, our other research in progress includes reviewing and rating evaluation instruments using the same process and the newly developed *Scale for the Evaluation of Program Evaluation Instruments* (SEPEI). For further information contact:

The University of Connecticut Research Site held its first press conference on January 27, 1992 announcing the findings of the Classroom Practices Survey, Curriculum Compacting Study, and Classroom Practices Observation Study conducted by Dr. Francis X. Archambault, Dr. Sally M. Reis, and Dr. Karen L. Westberg, respectively.

The Learning Outcomes Study

The University of Virginia

Marcia A.B. Delcourt, Lori Bland

The Learning Outcomes Study at the University of Virginia is a two-year investigation of academic and affective changes in students during their first two years in a gifted program (see NRC/GT Newsletter, November 1991). The study compares students enrolled in gifted programs, high ability students from districts where no program is available at the designated grade levels, and students in regular classrooms. Students from five types of program models are compared: within-class programs, pull-out programs, special classes, special schools, and no program. These children were assessed during the fall and spring of the 1990-91 academic year and will be assessed again at the beginning and end of the 1991-1992 school year. Effects of the program will be measured through multiple administrations of an achievement test, an attitudes toward learning survey, self-perception and motivation inventories, and teacher ratings of student learning, creativity, and motivation. An important dimension of the project is the examination of program effects on students from culturally diverse populations.

Initial Results: Year One

We first examined the descriptive characteristics of our sample. We found that students starting their first year in gifted programs scored approximately one year above grade level in academic achievement. For example, the average 2nd grade gifted student scored at about the 3rd year, 1st month grade level in Reading Comprehension, and the average 3rd grade high ability student scored at about the 4th year, 6th month in Reading Comprehension. Schools typically selected high achieving students for their gifted programs and these children continued to achieve at this level as indicated by spring testing. In analyzing the data from the first year of the study, we were interested in focusing on the academic and affective outcomes for White and Black female and male students in different types of programs as measured by "change scores." These values represent the difference between scores from the fall and spring.

Achievement. Initial findings indicate that students in special schools showed the most significant gains in Mathematics Problem-Solving, Social Studies, and Science when compared to students in all other types of programs. Students in pull-out programs had the highest scores in both the fall and the spring for Science. When looking across all program types, White students had higher mean scores for Science achievement in the fall and the spring; however, Black students showed a significantly greater gain in Science achievement than White students. These findings may be due to the fluctuations in curriculum across the different programs and it is important to track this progress over another year to examine whether or not this gain continues.

Attitudes toward learning. For students in special schools, we found that attitudes toward learning scores were higher for White males than for White females. In fact, attitudes toward learning for White females in special schools actually decreased. The change in attitudes toward learning for Black males in pull-out programs was more positive than the change in attitudes for Black females from these same programs. In this situation, attitudes toward learning for Black females also decreased. These patterns need to be observed over the next two data collection periods to examine their stability. Do the attitudes toward learning processes for females continue to decline? If so, do they decline at a faster rate than the attitudes of males? This issue may develop into a question for the follow-up study already under way as a sample of students and teachers in particular programs will be contacted concerning their experiences in their respective programs for the gifted.

Self-perception and self-motivation. Results from this research agree with the literature on self-concept regarding at least one aspect: There is no clear pattern for increases or decreases in different areas of self-perception for students in gifted programs. Two general theories have been postulated. One states that the self-concepts of gifted students should be high, related to their levels of high achievement, while another hypothesis predicts that self-concepts will be lower for students placed into gifted programs due to increased scholastic competition. Patterns from this research study reveal mixed results with students from specific programs showing both significant increases and decreases across different subscales of self-perception and self motivation. For example, students from pull-out programs showed the greatest gains in perceived Scholastic Competence, but had a significant decline in their scores on the Preference for Challenge subscale.

Teacher Ratings. The most striking pattern among these data is the lower change score for teacher ratings of students in special schools as compared to students in all other types of programs. Teachers in special schools rated students about the same in Learning and Motivation at the beginning and end of one academic year, but their ratings of student Creativity decreased over this same period (instrument-*Scales for Rating the Behavioral Characteristics of Superior Students*, Renzulli, Smith, White, Callahan, & Hartman, 1976). A possible explanation for the improved ratings for students in the other program categories is the point of reference used by teachers. In other words, teachers rating students from separate class programs, pull-out programs, within class programs, and comparison groups may have been comparing the characteristics of the subjects in the study to the characteristics of the many students in their classes and schools, therefore, seeing a greater gain in these characteristics and rating them above average more often than did the teachers from special schools. Another explanation for lower change scores from special school programs is related to the restriction of range for these scores. Since students in special schools entered their gifted programs with the highest mean scores for Motivation and Creativity and teachers provided consistent ratings during the spring, these scores showed the least amount of change over time.

In summary, the results reported here are still preliminary since this is the first year of this two-year study. The longitudinal design will provide important information concerning trends of behaviors. A qualitative follow-up to this study is already underway to investigate issues related to curriculum, environment, and program arrangement for each type of gifted program. A Theory-Based Approach to Identification, Teaching, and Evaluation of the Gifted

Yale University

Robert J. Sternberg, Pamela R. Clinkenbeard

In the first year of The National Research Center on the Gifted and Talented, the staff at the Yale University site began a five-year study based on Sternberg's Triarchic Theory. Our study is investigating three major aspects of gifted education — identification, teaching, and student evaluation — in one integrated project. The Triarchic Theory involves three aspects of intellectual ability: analytic, synthetic-creative, and practical-contextual. We will be identifying high school students who are gifted in one of each of these areas (as well as those who are balanced among the three abilities, and a control group). Identification will be followed by instruction tailored to the various abilities. We will be teaching several sections of an exploratory psychology class with one section tailored to analytic abilities, another to creative abilities, and so on. Equal numbers of students with each kind of giftedness will receive each kind of instruction, and all students will be evaluated through all forms of assessment: analytic, creative, and practical achievements. We are interested in performance differences between students who are in a course section that "matches" their type of giftedness, and students who are in a course section that stresses an ability different from their own strength.

Our main task in Year 1 was to develop the curriculum materials which will be used throughout the five years of the project. Our objectives for the first year were: 1) to write and revise the text materials for the exploratory psychology course; 2) to write accompanying curriculum materials for each text unit; 3) to conduct field testing of the Sternberg Triarchic Abilities Test with gifted populations (especially underserved groups both with respect to kinds of giftedness and to demographic status); and 4) to begin planning for a 1992 summer pilot program.

With respect to our accomplishment of these objectives:

- 1) We have completed a full round of revision work on 13 content units for the exploratory psychology course. The units of text are entitled What is Psychology?, How Psychologists Think, Behavioral Neuroscience, Learning, Consciousness, Sensation, Perception, Memory, Language, Thinking, Intelligence, Cognitive Science, and Cognitive Development. The What is Psychology? unit presents psychology as a field of study and as a career. How Psychologists Think discusses some of the philosophical underpinnings of psychology and briefly presents methodological and statistical issues, as well as the problem solving process through which any scientist works. Behavioral Neuroscience describes the mind-body connection, including basic physiological psychology. Learning covers the history and current status of research on classical and instrumental (operant) conditioning. Consciousness deals with issues of identity, sleep and dreams, and altered states of consciousness. The Sensation unit discusses the five basic senses (including a section on pain research under the topic of Touch), and covers basic principles of sensation such as signal detection. The Perception unit covers theories of perception and various kinds of recognition and

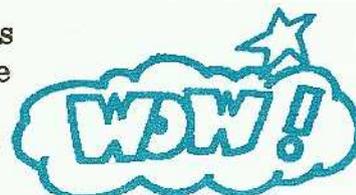

perception, including form and pattern, music, and reading. The Memory unit contrasts cognitive with more associationistic views of remembering and presents different theories of how information is processed and stored. Language presents information on the psychological and linguistic components of language, its relationship to thought, and cross-cultural differences in language. The Thinking unit presents inductive and deductive reasoning, problem solving and insight processes, and the development of the information-processing approach to research in the area. The Intelligence unit describes the history of intelligence theories and how they have evolved, and the relationship of intelligence to creativity. The Cognitive Science unit shows how psychology, computer science, anthropology, linguistics, and neuroscience are involved in the interdisciplinary study of cognition and mental models. Finally, the Cognitive Development unit integrates many of the other topics by discussing how perception, memory, and thought develop.

- 2) We completed a first draft version of the curriculum material which will differentiate the assignments related to these 13 units. This material, based partly on Renzulli's Enrichment Triad Model, includes Type I exploratory activities in analytic, creative, and practical domains; Type II group process-building activities in the three domains; and a Type III independent project. Further curriculum development will include differentiated in-class discussion questions and other suggestions for instructors.
- 3) With respect to development work on the Sternberg Triarchic Abilities Test, Yale site staff reviewed the current high school and college versions of the test, decided (a) what kinds of revisions were needed and (b) what type of data should be collected. The first revision of the STAT and preparation of a one-hour version suitable for screening for gifted students was partially contracted to Dr. Bonnie Nastasi, an Assistant Professor in school psychology at The University of Connecticut. She developed an experimental one-hour version of the STAT and gathered data on it from both gifted high school students and those not identified as gifted. Yale site staff gathered additional data from a variety of high school populations, and currently the STAT is undergoing further revision.
- 4) Finally, we met with Yale summer program staff and began negotiations for the services needed to produce our 1992 summer pilot program, where we will try out the identification process, the curriculum and the instructional procedure, and the assessment techniques with 40 to 50 high school students (the full-scale summer program in 1993 will involve 200 to 250 students).

We are pleased with our Year 1 results on this project, and at this point (December 1991) we are well into an exciting and informative Year 2.

Personal Note of Thanks

We are overwhelmed by the extremely large number of persons who responded to our request to write letters of support for the Javits Gifted and Talented Students Act. The favorable comments written in support of the NRC/GT will undoubtedly play a major role in continued funding for the Center. We extend our very sincere thanks to the many persons who took the time to write these very thoughtful letters to the Assistant Secretary. Everyone in the field owes you a debt of gratitude for your efforts.

Joe and Jean

My Gifts, My Talents ...Who Am I, Really?

The effects of grouping and labeling on the self-concept of gifted children are a common concern of educators and parents. For the first time a **comprehensive review** of the research on this important topic explores the major issue concerning self-concept and gifted children.

- *Do gifted and average children differ in their self-concepts?*
- *What are the effects on self-concept of labeling a child as gifted or exceptional?*
- *Does placing the child in a separate enriched or accelerated classroom have any impact on self-concept?*

Find the answers to these critical questions by writing for a copy of:

Self-Concept and the Gifted Child

by Dr. Robert D. Hoge - Carleton University and Dr. Joseph S. Renzulli - The University of Connecticut

Order No. 9103 - Executive Summary..... \$2.00

Order No. 9104 - Full Length Paper and including Executive Summary (available soon) \$10.00

Julie L. Sherman, Niantic, CT

David is a bright, energetic, thirteen year old adolescent. He loves soccer, basketball, movies, concerts, pizza, and Burger King. He also has an intense interest in astronomy, can speak English, Spanish, and Russian fluently, enjoys reading material commonly found on college campuses, and has a lifelong dream of attending a prestigious Ivy League school to eventually become a lawyer. These remarkable accomplishments, abilities, and aspirations coupled with age appropriate pressures and interests have proved challenging for David. Although he appears to have the best of both worlds, David and his parents have been forced to deal with common questions, pressures and concerns associated with gifted adolescents.

While many parents are exceptionally interested in learning about their adolescent's special needs, they do not have ready access to the necessary resources. Parents are unaware of the impact they have upon their child's ability to deal with giftedness. Therefore, through interviewing David and his mom, Mrs. S., this article will provide parents with a better understanding of gifted adolescents, and the role parents play in their development.

Research conducted by prevalent theorists in the field of gifted education has all led to one major conclusion. One of the single most recurrent traits of productive gifted students is high motivation and persistence (Franks & Dolan, 1982; Dunn & Griggs, 1985; Renzulli, 1984, 1986). The main reason that some students become successful and some do not is differences in their motivation, due in large part to family values (Terman & Oden, 1959). Albert (1975) also stressed that a crucial trait of geniuses he studied was the compulsion to be productive, the ability to work hard.

In Bloom's (1985) study of talent development on concert pianists, sculptors, mathematicians, and neurologists, he found that all had in common some very clear messages provided by parents.

... [P]arents placed a great stress on achievement and at doing one's best at all times... They were models of the "work ethic" in that they were regarded as hard workers... To excel, to do one's best, to work hard, and to spend one's time constructively were emphasized over and over again.

Throughout David and his mother's interviews, the existence of the traits found in gifted research was evident. David's parental influences have proved critical in his development. His parents have been instrumental in guiding their gifted child both in and out of school. High achievement, positive attitudes, and constructive behavior are expected and reinforced by David's parents. Therefore, these traits have become internalized by David.

JLS: David, what does it mean to be gifted?

David: To me to be gifted is to be naturally intelligent. You must be strongly motivated, and you must have a curiosity to learn and to discover. You always will want to do your best and achieve the highest you possibly can.

JLS: Are you gifted?

David: In a sense, yes. Academically I am strongly motivated, and I always have a curiosity to learn and discover. I am naturally intelligent in a way.

JLS: How did you find out that you are gifted?

David: I never actually found out. In the earlier grades I recognized that I was always achieving grades other children were not achieving. My teachers always complimented me, and my parents were always telling me to do the best I could because I have a special gift. I have also always enjoyed reading books. I have continuously been told that I read books above my reading level.

JLS: Above your reading level or the reading level of other children your age?

David: Above the reading level of other children my age.

JLS: Mrs. S., What does it mean to be gifted?

Mrs. S.: It means a lot. There are many ways to be gifted. I do not think it can be measured by a test, or any one particular measure. I think the children who are labeled gifted have a variety of gifts. You can be gifted intellectually. You can be gifted athletically, artistically, or musically. You can be gifted in your creativity. I think there is a sense of creativity to be gifted.

JLS: Is your son gifted?

Mrs. S.: Being a teacher and a parent it is fair for me to say, yes, my son is academically gifted. He has a strong motivation to do well. Sometimes I think it is linked to an overachievement. He wants to do better, therefore, he strives to try harder. But it comes very easily to him so there is not the presence of frustration other children might find.

JLS: How did you find out your son is gifted?

Mrs. S.: My husband and I have never had him tested as to whether or not he is gifted. It has never been important enough to either of us for him to have the label. My goal is to have all my children do the very best they can do. My husband and I are strong motivators. We provide many opportunities for him to express his giftedness, trips to the library, home projects, family travel. We believe in encouraging our children to do their best. If you are or are not labeled gifted is not important. What is important is to utilize what you were given, and that you do not waste any abilities.

JLS: David, what have your parents said to you about being gifted?

David: My parents have always encouraged me to do the best that I can. They continuously say not to waste what I have, my brain. My parents are very proud of me and are happy with my accomplishments.

JLS: What do your parents do to get you interested in new things?

David: My parents always encourage me. They show me the advantages of new things. If they want me to take karate lessons, they show me the advantages of knowing. Or if they want me to take an extra hard class like algebra, calculus, or they'll show me the advantages of being knowledgeable in that particular area.

JLS: Mrs. S., What have you told your son about being gifted?

Mrs. S.: It is not important if you are labelled gifted or not labelled. Although it is important to some people, I feel the important factor is making the most out of your abilities.

JLS: Does your child have any questions or concerns about being gifted?

Mrs. S.: Yes, he often asks why he is not labelled gifted while some of his friends are. He feels he performs equally to or better than these students.

JLS: What do you do to get your son interested in new things?

Mrs. S.: Getting David motivated to do new things is not easy. You can't just make a suggestion. You have to come up with reasons. You have to have explanations, demonstrations. He likes what he knows he can succeed at. Sometime it is very difficult to get him to try new things because of his desire not to fail.

Although many gifted students are typically risk-takers, this does not appear true in David's scenario. His parents must struggle to get David involved in new subjects areas. However, he loves astronomy and languages. In these two subject areas he becomes totally immersed in his ideas and creations, literally unable to rest until his work is complete. His mom often finds him in his room for hours writing poetry in Spanish or studying the possibility of life forms on other planets.

Why then is David reluctant to try new things? One explanation may be David's tendency to set high goals for himself. Even when involved in a new undertaking, he wants to succeed. If he does not, the natural outcome is disappointment, frustration, and feeling of incompetence. Parents are often baffled by displays of frustration and self-criticism by adolescents who are usually extraordinarily capable and talented. The frustration occurs not because the individual is comparing himself to others, but with his own high expectations. Parents must then reinforce the adolescent's attempts, demonstrate positive attitudes, and help him to use failure constructively.

Like many gifted adolescents, David is motivated to succeed. He feels responsible for his successes and failures, but he is in control of his destiny. Because of parental support, he is often able to attribute failure to lack of effort, not to lack of ability. A failure is viewed as a momentary setback that motivates him to try harder next time. A failure is a learning experience.

Academic Summer Camp: An Opportunity for Gifted Minority Students

Commentary

Richard Chandler,
Mathematics and Science Summer Institute, Arlington, TX

What if you were able to take exactly 100 identified gifted-minority high school students from Harlem, New York to central Long Island for a three-week camp-out during the summer vacation period? What if you were able to provide three university professors to teach courses in science, mathematics and computer science? Finally, what if you were able to bring together thirty high school teachers to serve as supervisors and mentors for these academically gifted students? Would it make a difference??

These questions frame the outline for a program that attempts to establish a viable alternative for disadvantaged minority students from Harlem, New York that have been identified as potentially gifted but are not performing up to their academic potential. These students are found to be at a crossroad in their lives and must make a serious decision concerning their academic future that will most certainly influence the rest of their lives. The primary goal of the summer program is to remove these students from a hostile damaging environment and place them in a rural-academic setting where

they will be able to review their situation and make some informed decisions.

In 1985 the germ of an idea to establish an academic summer camp for disadvantaged-gifted minority students was born! This initial program was designed to identify 100 gifted-secondary students from Harlem, New York and provide them with a three-week academic camp held at the Southampton Campus of Long Island University. Three university professors were hired to teach a three-week short course in Physical Science, Advanced Mathematics and Computer Applications. Thirty secondary teachers were also selected to receive a small subsistence allowance, to live and work with these students. Most of these functional components and activities were eventually funded by private foundations and/or private companies. The National Science Foundation (NSF) was able to fund the teacher participation for the initial three years of this summer program.

Because of the vast scope and many imponderable variables, attempts at establishing any type of statistical-research model have been unsuccessful.

Please see page 11

Parents From page 9

JLS: What happens when you make a mistake?

David: I really beat myself up. I hate when I make a stupid mistake. Even if it is not a stupid mistake, I get upset because I know I could have done better. Sometimes when I make a mistake I am embarrassed. I know that I should have tried harder.

With parental support David is able to deal with failures constructively. He is becoming more of a risk-taker. However, as he enters adolescence he is beginning to feel the effects of peer pressure. During adolescence, peer pressures become strongest and most influential. Gifted adolescents may succumb to the peer mandate that studying is not "cool". Positive family relationships help alleviate the tendency for gifted adolescents to underachieve. David's parents have supported his talents and have helped him confront peer pressures. They have pointed out the importance of achievement for future success. David's excellence in sports and his ability to play down academic talents have also been instrumental in eliminating some of the stereotypes associated with giftedness.

JLS: How are you the same as other children your age?

David: I am a lot like other children my age because I like to hang around with my friends. I like sports. I argue with my sister.

JLS: How are you different than other children your age?

David: I have a very strong desire to do the best I can and get a "100" or an "A" on everything that I possibly can. I always want to do well. If I get a poor grade, I carry that through the whole day, sometimes longer. Other kids just forget about it.

JLS: How do you feel about being smarter than some of your friends?

David: Sometimes it is embarrassing because my friends get mad at me if they don't get a good grade and I do. They get jealous. It is a very uncomfortable situation.

JLS: Did you ever try to do poorly so that other children would like you more?

David: No, I would never do that. I would always be mad at myself. I try to do the best I can.

JLS: Did you ever try to hide the fact that you are intelligent?

David: Yes, it is sometimes embarrassing. Other kids will look at me and be disgusted if they get a "B", which is not bad, and I get a "100". They will look at me with a type of distaste. I get embarrassed.

Despite some uncomfortable peer interactions, David has continued to strive for his goals and dreams. This is due, in large part, to parental role models. David's parents have encouraged him to excel. They support his efforts to work hard at all times. They believe he can and should work to attain the goals he has set for himself.

JLS: What do you want for your son in the future?

Mrs. S.: In the future, I want my son to be everything he wants to be. I don't want him to be frustrated in what he does, but I also want him to work hard and to have strong goals for himself and his future.

JLS: David, what would you like to learn about someday?

David: I've always wanted to learn lots of languages. I'm taking Spanish and Russian. I would like to take more. I enjoy languages. I have an interest in astronomy. I wonder, is there life on other planets?

JLS: What are your plans for the future?

David: In the near future I plan to go to high school and take another language, then go to college.

JLS: Have you thought about what college you would like to attend?

David: It's kind of a dream of mine, but I have always wanted to go to Harvard or Yale, maybe another very good Ivy League school. I want it to be a school that I can be proud of.

JLS: Where do you see yourself after college?

David: Lots of my friends continuously change their minds about future career plans. Not me. I am going to be a lawyer.

JLS: Why a lawyer?

David: Well, a lawyer uses his abilities to organize, reason, and think in order to help people. I think I would enjoy the hard work and dedication that is involved in becoming an outstanding lawyer.

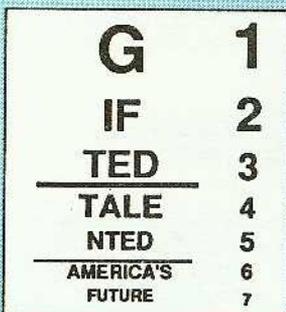

David is obviously motivated. This motivation, persistence, and compulsion to be productive have been influenced by parental values. David has internalized many of his parents' traits of high achievement, positive attitudes, and constructive behavior. Although he faces some concerns and pressures from himself and peers, he is able to overcome these adversities and aspire to his goals and dreams. In order for other gifted adolescents to succeed, parents must realize the significant role they play in their child's development, and the impact they have on their child's future success.

Seeing is Believing!

What Every Administrator and Policy Maker Needs to Know About the Research on Ability Grouping

1 Will the elimination of grouping cause our nation to lose its vision about the future?
 2 More than 60 years of research on the effects of ability grouping has resulted in what one school administrator called "a wilderness of mirrors" about this controversial and politically loaded topic. Now,

for the first time, one of the nation's leading research analysts has produced what one reviewer called the most objective review to date on grouping research.

- How have new methods of analyses enabled us to look at the research more objectively?
- How does political correctness influence the ways in which research is interpreted?
- What are the most defensible decisions about grouping that are supported by the research?

Find the answers to these and other critical questions about ability grouping by writing for a copy of James Kulik's new paper. Advocates of programs for the gifted and talented will want to share this paper with administrators and policy makers who are using the research on ability grouping to question the value of special programs.

An Analysis of the Research on Ability Grouping: Historical and Contemporary Perspectives

Academic Summer Camp From page 10

My purpose here is to provide a subjective description of this program for review, consideration and further discussion. The cost of this program demands a significant statistical assessment model, but I believe, intuitively, that this effort will provide generous benefits to our growing minority student population.

In 1985 the New York City Board of Education was frustrated by the obvious fact that many potentially gifted minority students at the secondary level were performing far below their potential and were unable to gain access to the "better" academic high schools. It was suggested that the Board of Education provide a series of special academic programs for these students. Several programs were proposed but each had major draw-backs that made them unacceptable. Our program proposed an intensive academic program in science and mathematics, to be held during the summer vacation period. These initial parameters proved acceptable to the Board and after several years of refinements and false starts the project was funded.

During the summer of 1989, the initial program was started. The first step was to identify middle school minority students that were known to be gifted academically but were performing below expectations. These students and their parents were interviewed by school personnel and the camp administrators. The primary consideration was that the students wanted to improve academically and their parents were supportive of their involvement in an academic summer camp.

We wanted the summer camp to be an extraordinary environment that would affect an attitudinal change in each student. The focus of all students, teachers and staff was to be upon academics in a clean, secure and healthy atmosphere that would be conducive to learning. The hope was to nurture young minds and develop a love for learning.

Daily Routine for Students

First thing in the morning was a good breakfast. This event proved to be a new experience for a large majority of the students. After breakfast, the students went through a sequence of three concurrent academic classes - 33 of the students attended mathematics during the first hour. Next they went to an hour of computer science and the final hour was for physical science. Each course was designed to challenge the student to seek more information in the subject area. Lunch was scheduled for two hours to provide time to eat and for a period of rest and free time. After the lunch period, a special course on SAT preparation was provided in the areas of language and mathematics. Immediately after this course, the students were provided a "mandatory" period of athletics. Soccer, tennis, swimming, volleyball, touch football and basketball were offered to all students. Dinner was scheduled next and a block of two hours was again provided for the students to eat and take care of personal needs. From approximately 7:00pm until 10:00pm, teachers provided individual help for a small group of students. At various times, students met with a special guest lecturer such as Sheldon Glashow, the Nobel prize winning physicist from Harvard University. On some week days, students visited Brookhaven National Laboratory or Cold Harbor Springs Research Facility. Two Sundays were set aside for family visits, athletics and other activities. On Friday and Saturday evenings, we had dances and other social opportunities. One Saturday we had a Mathematics Olympiad and on another Saturday we had a Physics Olympiad. During subsequent years, we were able to invite foreign students from France, Switzerland, Africa and Russia. These foreign students added immeasurably to our program.

Subjective Outcomes Viewed from Inside

The first few days that the students were at the camp were chaotic to say the least. There were several fights. Students "cut" classes and refused to participate fully in the activities. On the fourth day, the kind but firm hand of the teachers and a large degree of peer pressure began to provide the kind of atmosphere that we had hoped for! All students attended classes, participated in athletics and participated fully in the evening programs. Parent visits were met with amazement and delight at the progress their son or daughter was making in academics. During the last week of the camp, the teachers began to be truly challenged by the students and felt a genuine sense of accomplishment. The SAT program saw a jump of from 200 to 300 points on students' comprehensive scores. The closing ceremonies were punctuated with tears and laughter of joy. The Board of Education was to follow-up on these students, but no record of any type was ever kept. There is a general feeling that these students that attended this program were eventually successful and did go on to "better" high schools. But, the real proof as to the value of this program must lie in the long term effect on these students in college and in later life.

Six Thinking Hats for Schools by Edward de Bono

Do you know about the Six Thinking Hats method developed by Edward de Bono? If not, you must see a copy of the *Six Thinking Hats for Schools* (series of Teacher Resource Books for Grades K-2, 3-5, 6-8, 9-12). You have probably told your students at one time or another to "put on their thinking hats" as a way to get their attention to think hard. This phrase takes on a whole new meaning when you teach the thinking hats method.

In the introductory chapters of the book, the meaning for each thinking mode, signified by a different colored hat, is explained and accompanied by several illustrations for practice. Teachers and students learn to associate the colored hats with key words and questions. This directs, redirects, and sequences their thinking.

Sample key words and associated questions follow.

| | |
|---|---|
| White Hat: Information What are the facts? | Yellow Hat: Benefits What are the good points? |
| Red Hat: Feelings What do I feel about this? | Blue Hat: Thinking What thinking is needed? |
| Black Hat: Judgment What is wrong with this? | Green Hat: Creativity What new ideas are possible? |

Some sample student activities to introduce the six thinking hats include the following:

Put On Your Yellow Hat

A local grocery store has decided to sell only products that are better for the environment - like recycled paper items, vegetables grown without pesticides, and household cleaners that don't pollute. Who will benefit? What are the benefits? (page 54)

Put On Your White Hat

Arriving home from school, you find that the door is locked and no one answers. Someone is usually at home at this time of day. What information do you need, and what are your sources for the information? (p. 70)

Put On Your Green Hat

There has been an outbreak of car thefts in your neighborhood. What are some creative ways to stop the thieves? (p. 85)

The *Six Thinking Hats for Schools* is so well designed that teachers will feel comfortable implementing the lessons after reading about the thinking hats concept and experimenting with the practice activities. All lessons are organized with background notes, guidelines for discussions, reproducible activities, and discussion notes. Students learn about the thinking modes using a lesson format that includes: lead-in, explanation, demonstration, practice, and elaboration. The lesson format is a simple, but effective, paradigm that can be used to create new lessons that expand the curriculum. In fact, Edward de Bono illustrates just how this was done in the final section of the book on sample applications. Model lessons developed by classroom teachers focus on the typical content areas of language arts, social studies, science, math, art, and music. But, of course, with de Bono's work he always goes beyond what is expected. Two additional areas are conflict resolution and conflict avoidance.

Teachers and students will certainly enjoy Edward de Bono's *Six Thinking Hats for Schools* which is available from Perfection Learning, 10520 New York Avenue, Des Moines, Iowa. 50322.

Building School Capacity for Effective Teacher Empowerment: Applications to Elementary Schools With At-Risk Students by Henry M. Levin (\$10)

The term "teacher empowerment" may already be fading from use, in large measure because of its vagueness. Does it mean giving teachers authority over school-level and/or classroom decisions? Does it involve mainly issues of governance? Does it focus mainly on classroom effectiveness and enhancement of teachers' knowledge of content and instructional strategies?

Levin argues that decentralizing decision-making and increasing school staff participation in running schools are necessary elements of teacher empowerment. But they are not enough. Capacity-building at the school and district level is required to make teacher empowerment "more than a tantalizing slogan," says the author.

Drawing on his experience in developing accelerated schools for at-risk students in five states, Levin discusses features of school-based decision-making that could be the focus of a capacity-building effort. The paper addresses topics such as leadership, technical assistance, and accountability.

Teacher Empowerment and Professional Knowledge by Gary Lichtenstein, Milbrey McLaughlin and Jennifer Knudsen (\$7)

This paper presents a view of teacher empowerment which includes professional knowledge as a crucial aspect. The authors also propose a new definition of "professional knowledge" for teachers, one that goes beyond staff development efforts and other commonly proposed strategies to enhance teacher knowledge.

After a year of field study and literature review of structural, formal, and institution-based efforts to empower teachers, the authors found that decentralization or enhanced teacher authority did not necessarily lead to teacher empowerment. The authors then shifted their research to look at knowledge-based reforms.

Through this approach, the authors discovered teachers who believe they are empowered in principle and practice, whose attitudes about teaching are upbeat, hopeful, and even enthusiastic. These teachers believe their practice represents a model of professionalism that ought to be widely developed.

Have You Been Reading *The Creativity Research Journal*?

Mark A. Runco, *California State University, Fullerton*

Educators and individuals interested in gifted and talented children will enjoy the first 1992 issue of the *Creativity Research Journal* (vol. 5). It is devoted to "Play, Imagination, and Vygotsky's Theory," and contains articles by Brian Sutton-Smith, A. Pellegrini, Janet Sawyers, Olivia Saracho, Francine Smolucha, Saba Ayman-Nolley, and Vera John-Steiner.

Other CRJ articles are also relevant to the study of gifted and talented students, including "Family adaptability, cohesion, and creativity" (John Moran, vol. 3); "Social influences on creativity" (Theresa Amabile, vol. 3); "Development of creative skills: A must for science education" (Yager, vol. 2); "Teacher's creativity, playfulness, and style of interaction with children" (Janet Sawyers, vol. 2); "On the development of creativity in children" (Urban, vol. 4); "Maternal teaching techniques and preschoolers' ideational fluency" (Goble et al., vol. 4); and "Mother-child relationships and creativity" (Stephanie Dudek, vol. 4).

The Editor welcomes articles specifically on the creativity of gifted and talented children. Write to Mark A. Runco, CRJ Editor, EC 105, California State University, Fullerton, CA 92634. (Email: Runco@Fullerton.edu) (Fax: 714-773-3314)

The CRJ is published four times each year by Ablex Pub. Corp., 355 Chestnut St., Norwood, NJ 07638 (Tele: 201-767-8450)

Ablex has also recently published: Roberta Milgram's *Counseling Gifted and Talented Children*; Arthur Cropley's *More Ways Than One: Fostering Creativity in the Classroom*; and John Wakefield's *Creative Thinking: Problem Solving Skills and the Arts Orientation*.

Several volumes are expected in 1992, including Rena Subotnik's *Genius Revisited: High IQ Children Grown Up and Beyond Terman: Longitudinal Studies in Contemporary Gifted Education*.

CAN COOPERATIVE LEARNING BE ADAPTED TO BENEFIT GIFTED STUDENTS?

The current controversy on ability grouping and cooperative learning has endangered or eliminated many programs for gifted and talented students. Yet, research on cooperative learning's effect on gifted students has been **inadequate and superficial**.

Program modifications may have to be made to enable gifted students to benefit from cooperative learning. Advocates and decision makers must be able to address questions based on an analysis of the research evidence.

- *What weaknesses exist in the cooperative learning research base?*
- *What risks exist for gifted students who participate in cooperative learning?*
- *How can cooperative learning be implemented for gifted and talented students?*
- *Should cooperative learning ever be used as a substitute for programs for the gifted?*

Find the answers to these questions in

Cooperative Learning and the Academically Talented Student

How the Structure of the Intellect Tests and Curriculum Identify, Develop, and Maintain Giftedness

Mary Meeker, *SOI Systems, Vida, Oregon*

Decades ago Dr. Joy P. Guilford created a theory of multiple intelligences represented graphically by a three-dimensional cube. This model of intelligence, known as the Structure of the Intellect (SOI), initially included 120 cells along three dimensions: Content - figural, symbolic, semantic, and behavioral; Product - units, classes, relations, systems, transformations, and implications; Operation - evaluation, convergent production, divergent production, memory, and cognition. The theoretical model eventually expanded to include 180 cells. Research by Meeker and others extended the use of the Structure of the Intellect and the accompanying learning abilities tests as a diagnostic-prescriptive approach to the teaching of thinking skills. Summaries of research studies focusing on special populations using the SOI curriculum 30 minutes a day, three times a week are highlighted.

Longitudinal studies of Native Americans (1977-1981)

Compiling and documenting patterns of abilities from various studies in which Navajo, Shoshone, Comanche, Nez Pince and Canadian Indians (west and eastern coastal) were identified as gifted, showed that there were remarkably similar patterns of intellectual abilities among the groups. Strength areas included figural-spatial abilities, visual memory for details, auditory memory, and symbolic abilities. Areas that needed further development were: convergent production, vocabulary, verbal relations, verbal systems, and classification abilities.

Knowledge about these abilities, when used as a basis for meeting individual needs of Native Americans, has resulted in increased motivation to stay in school, to improve grades and achievement and eventually to seek college admittance.

Longitudinal studies of Hispanic Americans (1975 to the present)

Various age groups of Hispanic students in California, New Mexico, Texas, and Florida, from children to engineering students at technological universities in Mexico, have been and still are being studied. As a group, they initially showed high ability in creativity and symbolics. Classification and semantic abilities needed to be encouraged.

After programming was done to match curriculum to their strengths and weaknesses, several changes occurred. First, the parents began to feel a part of the community and far fewer families moved frequently. Secondly, intellectual growth in the younger students was slow, but steady. If the program was sustained over two years, there was rapid improvement in achievement. Even at middle school and high school, grades improved and there was a desire to remain in school until graduation.

Longitudinal studies of African Americans

Boys with patterns of high auditory memory, but low visual memory, will do much better in arithmetic and mathematics than in the language arts where visual memory is required. Low visual memory, in combination with low semantic abilities, almost guarantees failure in subjects requiring reading in school. The obvious solution, of course, was to include daily intellectual abilities lessons in the primary grades that developed visual memory, vocabulary, verbal relations and verbal sequencing. In schools where this change took place, school failure was significantly reduced.

Strength areas of African American students included auditory memory, figural and motor abilities with visual memory and semantic memory requiring more attention. For example, highly skilled college football athletes who showed long standing low semantic abilities, even with advanced auditory memory and spatial abilities. After a year of daily SOI training, their semantic abilities improved enough for them to make qualifying scores on the SAT (Michelles, Tulane University), thus allowing them to play collegiate ball.

Studies of students who are deaf or hearing impaired

As early as 1979, educators of the deaf, dissatisfied with consistent below average IQ test scores on students with hearing impairments, designed studies to identify specific intellectual strengths. They were, of course, searching as well for potentially gifted students. The first report showed students with hearing impairments had differential intellectual developmental growth expectancies in SOI abilities. There was a three year deficiency in most abilities except for figural classifications which crossed both gender and three grades, suggesting that the initial learning process for storing information was a classifications strategy. In other words, each new item was comprehended and stored on its basis for being similar to something already known.

When we average all SOI tests, we find that even though there was a three year over all delay in progress for students who are deaf or have hearing impairments, they nevertheless made, as a group, scores in the gifted range in visual memory, systems thinking, and figural classifications.

Studies using the Structure of Intellect learning abilities tests and curriculum have confirmed the importance of diagnosing students' strengths and weaknesses in cognition, memory, convergent production, divergent production, and evaluation. The diagnosis of skills leads to a prescriptive approach using curriculum to teach the abilities that are low, maintain the abilities that are high, and develop other abilities.

Family Personality and the Creative Potential of Exceptionally Gifted Boys

Abstract

Robert S. Albert, *Pitzer College*
Mark A. Runco, *California State University, Fullerton*

The California Psychological Inventory (CPI) was administered to two samples of adolescents (N=54) and their parents as part of an on-going longitudinal investigation of exceptional giftedness. The adolescents were selected based on either IQ (all in excess of 150) or math-science abilities (e.g., age 11 SAT-Mathematics scores at the 99th percentile). CPI profiles indicated that both groups of adolescents had low scores on the Well-Being scale, and there was some indication across several scales of low sociability. While the parents' profiles were relatively uniform, there were significant differences in intrafamily similarity, with the High IQ families being more similar than the Math-Science families. Finally, correlational analyses indicated that several scales from the CPI were associated with creativity scores of the adolescent boys.

Effects of Radical Acceleration on Educational and Career Attainment of Young Women and Men

Abstract

Kathleen Noble, *University of Washington*

The Early Entrance Program (EEP) at the University of Washington has been in operation since 1977, enabling 15 students each year, maximum age 14, to enter the UW without attending high school. Studies to date indicate that the majority of these students perform extremely well academically, and become well integrated into the University community. However we do not know what effect participation in the EEP will have on students' subsequent personal and professional adult lives, nor whether any gender differences will exist in these effects. This study begins the accrual of a data base to provide current answers to a number of critical questions about the radical educational acceleration of gifted, qualified adolescents.

RESEARCH IN PROGRESS

Problem Finding Skills As Components in the Creative Process *Abstract*

Ivonne Chand, Mark A. Runco
California State University, Fullerton

The present investigation compared the effects of explicit and standard instructions on six tests of divergent thinking. Two of these tests assessed real world divergent thinking; two tests assessed real world problem generation; and the last two assessed a combination of problem generation and divergent thinking (i.e., examinees chose one of the problems they had themselves identified, and then generated ideas and solutions). Importantly, all tasks focused on problems occurring in the natural environment. In particular, examinees (80 college students) were asked to give solutions for problems concerning both work and school situations. The results revealed significant differences among the different tests and differences between the explicit and standard instructional groups. Importantly, only the scores elicited by explicit instructions were significantly correlated with—and predictive of—creative activities and accomplishments. Implications for future research are discussed.

Resilient Youth: Case Studies of Disadvantaged Gifted Adolescents *Abstract*

Ann Robinson, University of Arkansas at Little Rock

Against the odds of economic, social, and educational disadvantage some remarkable youth develop as talented individuals capable of high-level performance. A qualitative study of economically disadvantaged youths who attended the 1988 Arkansas Governor's School is underway at the University of Arkansas at Little Rock. Over a period of two years, four youths have been followed through high school graduation and the first year of college. The study attempts to document the effects of the residential governor's school on economically disadvantaged youth. Students' social relationships, post secondary aspirations, and epistemological beliefs are under investigation: Werner's concept of resiliency, which is defined as successful adaptation to stressful life experience, is the framework used to describe and account for the development of high-level performance among gifted youth from impoverished homes.

The investigators are interested in establishing contacts with other researchers currently investigating economically disadvantaged gifted youth. Please write:

Opportunity for All Teachers

Curriculum Compacting: A Process
for Modifying Curriculum for
High Ability Students

By
Dr. Sally M. Reis
The University of Connecticut

- Why are so many above average ability students unchallenged in school?
- How can teachers overcome the effects of "dumbed down" textbooks?
- What can be done to increase the challenge level of standard curricular material?
- What does research tell us about the effectiveness of curriculum compacting?

Learn the step-by-step compacting process and find answers to the above questions by tuning in to a national staff development training program. This is an unusual opportunity for advocates of special programs for gifted students to initiate a low cost training program for all teachers in your district.

The program will include:

- An interactive satellite broadcast that your school can access directly or through a local cable company
- A facilitator's guide
- A reproducible teacher's handout packet

A \$100 fee will be charged for unlimited enrollment.

Stage, Structure, and Complexity in the Drawings of Middle Childhood: A Developmental Model of Artistic Ability

Abstract

Marion Porath, University of British Columbia

The period of middle childhood (children aged 4, 6, 8, and 10) is the focus of this study which seeks to define the characteristics of artistic ability within a model of giftedness. The model combines neo-Piagetian stage theory (Case, 1985), a perspective which identifies formally parallel, age-related characteristics of children's cognition across a variety of domains and modular views of exceptionality. These views argue for advanced development in the area of giftedness (Feldman, 1986; Gardner, 1983).

Each child in the sample (N=217) completed five drawing tasks. The tasks were designed to reflect increasingly complex demands in organizing the elements of the drawing according to rules of perspective. The young gifted artists in the sample have been found to be age-typical in their ability to render perspective. Their drawings, however, are

characterized by advanced development in specific artistic skills such as understanding of composition and colour and sophisticated graphic ability. Formal analyses of these elements are now underway.

Educational applications will include guidelines for identification of young gifted artists and for the nature and appropriateness of instruction at different stages of development.
